Kapil Gupta

Email: kapilguptansit@gmail.com | Phone: +919686262560
github.com/kapilgupta101292 | linkedin.com/in/kapilguptansit

Skills

Languages: TypeScript, Python, Java, JavaScript, SQL

Technologies & Tools: NestJS, NodeJS, Postgres, MongoDB, React, AWS, Terraform, Spring Boot, Kafka, Elasticsearch, Git, UNIX, Microservices, RESTful APIs, Agile methodologies

AI/LLM: Claude Code, Cursor, MCP, Anthropic SDK, agentic workflows, tool calling, durable execution, LLM evals, LLM-as-judge, prompt and context engineering

Work Experience

Sploot, Gurugram Feb 2025 - Present

VP of Engineering

Hands-on engineer, leading a lean, AI-native team that owns Sploot's complete technology stack (backend, web, mobile apps, AWS infrastructure and applied AI) for 80,000+ pet parents. Writes production code daily with AI coding agents, and re-platformed the legacy system into a scalable, well-tested platform while the business kept running.

Key projects:

- Designed and built an AI-native development workflow around agentic coding tools like Claude Code and Cursor, where design specs are broken into agent-executable tasks that coding agents implement and verify, MCP servers (Postgres, MongoDB, Figma) give agents access to real schemas, data and designs, and a Slack bot turns bug threads into ready-to-investigate agent prompts. An in-house code review pipeline runs in CI with static checks and architecture rules followed by an LLM review stage, allowing the team to deliver with high velocity and good quality.
- Currently building an agentic Customer Care and Ops system on an in-house ticketing system that replaced Freshdesk, leading to a significant improvement in customer experience and cost savings. Durable agentic workflows use LLM tool calling (GPS tracking, booking history, refunds) and per-partner long-term memory to resolve common customer and partner issues or escalate them as pre-triaged tickets with AI-drafted replies, with human-in-the-loop guardrails. Evals were designed up front, with a reference set reviewed by domain experts, decision-accuracy and escalation metrics, and LLM-as-judge calibration.
- Designed and put into production automated verification of partner session photos using OpenAI Decisions API models, checking photos in batches for SOP compliance and service quality (kit, uniform, grooming, clean-up). Failed photos are flagged for human review, and accuracy is measured against a labelled eval set before any prompt or model change ships.
- Designed and built an automatic partner matching system based on configurable parameters such as service radius, rating, customer preferences and partner availability (working hours, leaves and existing appointments). This system currently handles ∼80% of session requests automatically, freeing significant manual work for the operations team.
- Designed and built an end-to-end commerce platform covering product and service discovery, cart, discounts, checkout, Juspay and Cashfree payment integration, order fulfillment and refunds. Paid orders are processed into subscriptions and scheduled sessions, with support for prepaid, booking-fee and postpaid payments, order edits, partial cancellations and a loyalty coins ledger.
- Architected and built a rules-driven partner earnings engine supporting base pay, incentives, tiered penalties and minimum guarantee, with idempotent, event-driven evaluation. Ops configure pay rules without code changes, earnings are recalculated automatically as ratings and tips arrive without double payments, and daily to monthly summaries, loan EMIs, wallets and payouts replaced a manual spreadsheet process, giving partners full visibility into their earnings.
- Automated partner onboarding and KYC using Cashfree PAN and bank account verification, reducing verification time from 1-2 days to a few minutes. Partners complete a self-serve onboarding flow in the app (profile, training, joining fees, documents), and mismatched identity or invalid bank details are caught before any payout, enabling onboarding of thousands of partners during hiring drives with minimal ops effort.
- Set up the complete CI/CD and infrastructure on AWS ECS with Jenkins and Datadog, and established exhaustive test coverage across the platform with monitoring and alerts on every critical business flow, improving release confidence and platform reliability.
- Consolidated the separate Android and iOS apps into React Native customer and partner apps sharing one codebase, shipping to both platforms in one release cycle, and led the rebuild of the Sploot website on a modern open-source stack optimised for SEO and GEO, moving the shop off Shopify onto the main domain.

Clipboard Health, (Remote) Apr 2022 - Feb 2025

Full Stack Developer

- Built an Invoice dispute management system, to manage and resolve invoice related issues between CBH and healthcare facilities.
- Implemented a system to automatically verify the Personal ID (Driving License, State ID or Passport) using Stripe Personal Identity offering to automate >30K document verifications per month reducing average review time from 60 mins to ∼1 min.
- Designed and implemented a service to automatically verify state license data for Certified Nursing Assistants completely removing the need for manual verification of about 7.5k licenses per month and reducing review time to 10 seconds.
- Worked on streamlining the requirements handling for healthcare shifts, with ticketing automation, rule triggers to improve the efficiency on support ticket priority assignment improving the shift fill rates.
- Designed and developed an integration with Radar location tracking for getting location data for the Health care professionals to prevent fraud payment scenarios.

Studypad India Pvt Ltd, New Delhi Dec 2020 - Apr 2022

Full Stack Developer - Tech Lead

- Led the development of a comprehensive Gamification project, designing and implementing backend reward system to enhance student engagement and learning outcomes
- Architected and developed complete backend infrastructure for student rewards, ensuring scalability and performance
- Designed and developed robust service for product checkout process through Stripe API integration
- Implemented and optimized API Gateway integration with custom authentication logic on AWS cloud
- Utilized Java, Spring Boot, Kafka, Elasticsearch, Rails, React, and AWS to build and maintain scalable, high-performance applications

Sirion Labs Pvt Ltd, New Delhi Feb 2019 - Dec 2020

Senior Software Engineer

- Spearheaded development of Microsoft Teams add-in, creating Node.js backend for seamless communication with registered users
- Designed and developed Audit-Log service using Golang and Elasticsearch, enabling efficient auditing of user actions
- Implemented two-factor authentication using time based OTP, significantly enhancing application security
- Architected and developed Outlook Plugin Integration Service for governance meeting management
- Contributed to the integration of JSON Web Tokens (JWT) for stateless authentication

Oracle India Pvt. Ltd., Hyderabad Oct 2015 - Jan 2019

Application Developer III

- Developed and enhanced features for Projects Portfolio Management (PPM) in Oracle Cloud Applications
- Created innovative file-based loader for importing rates data, implementing complex validations and business rules in Java
- Led development of Excel-based Rapid Implementation solution, accelerating new customer onboarding for PPM offering
- Architected and implemented PL/SQL API for rate overrides, efficiently handling bulk data and performing business validations
- Optimized database queries and conducted performance tuning to achieve optimal system performance

Qualcomm India Pvt. Ltd., Bangalore Jun 2014 - Oct 2015

Associate Engineer

- Designed and maintained robust framework for running functional and analysis tests on SRAMs using PERL
- Contributed to memory compiler development for cutting-edge 14nm and 28nm technologies
- Implemented and automated various test procedures for rapid and comprehensive analysis of memory circuits
- Developed scripts to automate repetitive tasks, significantly reducing manual effort and increasing team productivity

Education

Netaji Subhas Institute of Technology, Delhi University 2010 - 2014

B.E. (Hons) in Electronics and Communication Engineering

Graduated with honors, demonstrating strong academic performance and technical aptitude. Awarded Merit Certificate and tuition fee waiver for all 4 years of B.E. program.

Achievements and Publications

- **Winner, Oracle Cloud Applications-Hackathon (2017):** Created a prototype for Oracle Fusion Applications assistant, enabling interactive application usage with documentation feedback and error handling
- **3 Qualstar Awards, Qualcomm India Pvt. Ltd. (2015):** Recognized for exceptional performance and outstanding contributions to ongoing projects.
- **Presenter, India Educators' Conference (TIIEC), Texas Instruments (2013):** Designed and developed an innovative device for real-time energy usage monitoring, attachable to existing electricity meters

Additional Information

- Active contributor to open-source projects related to Java and Spring Boot
- Regular participant in local tech meetups and conferences
- Languages: English (Professional), Hindi (Native)
